

# Correct syntax for DHCP Option 66 on pfSense with FreePBX

With the Windows DHCP server, I just had to enable Option 66 and enter the IP address and it worked perfectly. However with pfSense, simply entering the IP address doesn't work.

On pfSense, go to your DHCP server, add option 66, with a type of 'Text', and a value of: `tftp://IP_OF_FREEPBX_SERVER`

Here's what mine looks like.

<b>Option</b>	<input type="text" value="66"/>	<input type="text" value="Text"/>	<input type="text" value="tftp://10.10.30.10"/>
	Number	Type	Value
<b>Add</b>	<input type="button" value="+ Add"/>		
	<input type="button" value="Save"/>
